DETAILED ACTION

Election/Restrictions

Applicant's election with traverse of claims 1-3 in the reply filed on 09/25/2006 is acknowledged and have been examined on the merits.

Claims 4-6 are withdrawn from further consideration pursuant to 37 CFR 1.142(b) as being drawn to a nonelected invention.

Applicant traverses that the examiner has arbitrarily dissected out different developmental processes affected by FSH. However, as stated in the restriction requirement dated 8/23/2006 the additional methods claimed by applicant have different functions/effects. Applicant appears to agree in stating that the methods are different developmental processes. The restriction requirement is maintained.

Claim Objections

Claim 1 and its dependents are objected to because of the following informalities:

Applicant claims "kenesin heavy chain." This is assumed to be a typo and is interpreted to be kinesin. Appropriate correction is required.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1,2 and 3 are rejected under 35 U.S.C. 102 (b) as being anticipated by Grieshaber et al (Endocrinology, vol. 141, 2000).

Application/Control Number: 10/696,562

Art Unit: 1657

Applicant claims a method of altering regulation of gene expression of either β -tubulin, tropomyosin-4, kinesin heavy chain or combinations thereof by contacting the genes contained within a granulosa cell, with follicle stimulating hormone (FSH) at preantral or early antral stages of development.

Grieshaber et al also teach the contacting granulosa cells with FSH to study the importance of early events of hormone signaling during FSH-induced cell differentiation, associated with the cytoskeleton (p.3462 1st full paragraph). They teach the importance FSH plays in granulosa cell differentiation and follicular development during ovulation. The early events of cell differentiation involves changes in cell morphology and cell-cell interactions, i.e cytoskeletal changes. Further, they disclose the importance of differentiation and growth of granulose cells during the preantral period (see p.3461 1st paragraph).

Thus, the reference anticipates the claimed subject matter.

Claims 1 and 2 are rejected under 35 U.S.C. 102 (b) as being anticipated by Ben-Ze'ev et al (Journal of Biological Chemistry, vol. 262, 1987.

Applicant claims a method of altering regulation of gene expression of either β -tubulin, tropomyosin-4, kinesin heavy chain or combinations thereof by contacting the genes contained within a granulosa cell.

Ben-Ze'ev et al teach treating granulosa cells with FSH to study organization and the expression of cytoskeletal proteins. Specifically they teach β-tubulin to be contained with the granulosa cells treated with FSH (see p.5370, 1st full paragraph). They further

teach the importance and involvement of cytoskeleton in granulosa cell differentiation and development. Further, the changes in cell morphology and cytoskeleton organization associated with granulosa cell differentiation bring about changes in the expression of the respective cytoskeletal protein genes (see p.5376, 1st full paragraph).

Thus, the reference anticipates the claimed subject matter.

Claims 1 and 2 are rejected under 35 U.S.C. 102 (b) as being anticipated by Clouscard-Martinato et al (Animal Genetics, vol. 29, 1998).

Applicant claims a method of altering regulation of gene expression of either β -tubulin, tropomyosin-4, kinesin heavy chain or combinations thereof by contacting the genes contained within a granulosa cell.

Although, the reference do not disclose the specific genes, they are contacting the cell with FSH, thus, the cells must inherently contain the claimed genes.

Thus, the reference anticipates the claimed subject matter.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 1-3 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ben-Ze'ev et al (Journal of Biological Chemistry, vol. 262, 1987) or Clouscard-Martinato et al (Animal Genetics, vol. 29, 1998), or Grieshaber et al (Endocrinology, vol. 141, 2000) as supported by Kimble et al Genetics, vol.126, 1990), along with http://www.sdbonline.orgfly/cytodkel/tubet1-1.thmhttp://pbil.univ-lyon1.fr/cgi-bin/acnuc-search-id?query=TPM4_RAT&db=Hoverprot&ide).

Applicant claims a method of altering regulation of gene expression of either β -tubulin, tropomyosin-4, kinesin heavy chain or combinations thereof by contacting the genes contained within a granulosa cell, with follicle stimulating hormone (FSH) at preantral or early antral stages of development.

Ben-Ze'ev et al teach treating granulosa cells with FSH to study organization and the expression of cytoskeletal proteins. Specifically they teach β-tubulin to be contained with the granulosa cells treated with FSH (see p.5370, 1st full paragraph). They further teach the importance and involvement of cytoskeleton in granulosa cell differentiation

Art Unit: 1657

and development. Further, the changes in cell morphology and cytoskeleton organization associated with granulosa cell differentiation bring about changes in the expression of the respective cytoskeletal protein genes (see p.5376, 1st full paragraph).

Clouscard-Martinato teach the importance of FSH in follicle development and maturation. They teach granulosa cell response to FSH by stimulating gene expression of those involved in folliculogenesis (see Introduction section). While they do not teach the alteration of the specific genes claimed by applicant, they do teach the method of altering gene expression by contacting granulosa cells with FSH.

Grieshaber et al also teach the contacting granulosa cells with FSH to study the importance of early events of hormone signaling during FSH-induced cell differentiation, associated with the cytoskeleton (p.3462 1st full paragraph). They teach the importance FSH plays in granulosa cell differentiation and follicular development during ovulation. The early events of cell differentiation involves changes in cell morphology and cell-cell interactions, i.e cytoskeletal changes. Further, they disclose the importance of differentiation and growth of granulose cells during the preantral period (see p.3461 1st paragraph).

Kimble et al, along with http://www.sdbonline.orgfly/cytodkel/tubet1-1.thm, teach the β-tubulin gene to be a cytoskeletal gene important in cytoskeletal reorganization and development associated within the oocyte. Tropomyosin-4 is also known to be a cytoskeletal gene (see http://pbil.univ-lyon1.fr/cgi-bin/acnuc-search-id?query=TPM4 RAT&db=Hoverprot&ide).

None of the references specifically teach altering the regulation of gene expression of β-tubulin, tropomyosin, kinesin heavy chain or combinations thereof.

At the time of the claimed invention, it would have been obvious to one of ordinary skill in the art to contact granulosa cells with FSH and expect to see alteration of genes associated with the cytoskeleton. It is known in the art, as discussed above, that FSH plays a crucial role in cell differentiation and follicular development during ovulation, especially in early events of granulosa cells differentiation involving changes in cell morphology and cell-cell interactions, i.e the cytoskeleton. FSH is known to in the art to effect the expression of cytoskeletal proteins, i.e. cytoskeletal genes, thus, a gene such as β-tubulin, which is a cytoskeletal gene within granulosa cells would appear to inherently be altered when contacted with FSH.

Moreover, at the time of the claimed invention, one of ordinary skill in the art would have been motivated to observe an alteration in gene expression of genes associated with the cytoskeleton when granulosa cells, the home to such genes, are exposed to FSH because FSH is known to be important in cell differentiation and follicular development during ovulation. Cell differentiation involves changes in cell morphology and cell-cell interaction, i.e cytoskeletal changes. Thus, one would reasonably expect alteration of cytoskeletal genes expression granulose cells are contacted with FSH.

Thus, the claimed invention as a whole is prima facie obvious over the prior art.

Art Unit: 1657

Conclusion

No claims are allowed.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Tiffany M. Gough whose telephone number is 571-272-0697. The examiner can normally be reached on M-F 8-5 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Jon Weber can be reached on 571-272-0925. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
